Trusted Advisors for Delta Pilots since 1987

Referral Letter

We appreciate the chance to serve you here at The Davis Group.

We are working to expand The Davis Group financial and retirement planning services in an effort to reach as many Delta Pilots as we can. We thought you might be able to help.

If possible, could you take a minute and list any Delta Pilots you know could benefit from a complimentary comprehensive wealth management plan. Or, if you are part of or aware of any Delta Pilot groups or associations we should be aware of, please let us know.

You can do so by contacting Ray at: ray.davis@raymondjames.com.

Best Regards, Mark Davis

How to Get a Bigger Social Security Retirement Benefit

Many people decide to begin receiving early Social Security retirement benefits. In fact, according to the Social Security Administration, about 72% of retired workers receive benefits prior to their full retirement age. 1 But waiting longer could significantly increase your monthly retirement income, so weigh your options carefully before making a decision.

Timing counts

Your monthly Social Security retirement benefit is based on your lifetime earnings. Your base benefit--the amount you'll receive at full retirement age--is calculated using a formula that takes into account your 35 highest earnings years.

If you file for retirement benefits before reaching full retirement age (66 to 67, depending on your birth year), your benefit will be permanently reduced. For example, at age 62, each benefit check will be 25% to 30% less than it would have been had you waited and claimed your benefit at full retirement age (see table).

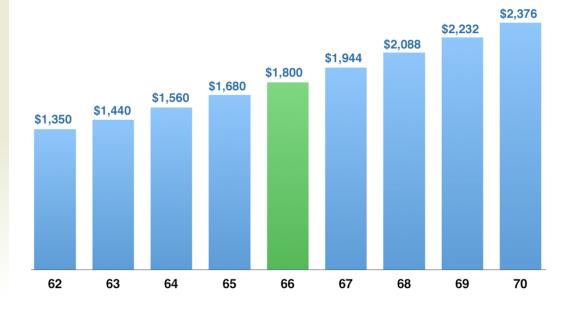

Alternatively, if you postpone filing for benefits past your full retirement age, you'll earn delayed retirement credits for each month you wait, up until age 70. Delayed retirement credits will increase the amount you receive by about 8% per year if you were born in 1943 or later.

The chart below shows how a monthly benefit of \$1,800 at full retirement age (66) would be affected if claimed as early as age 62 or as late as age 70. This is a hypothetical example used for illustrative purposes only; your benefits and results will vary.

Birth year	Full retirement age	Percentage reduction at age 62
1943-1954	66	25%
1955	66 and 2 months	25.83%
1956	66 and 4 months	26.67%
1957	66 and 6 months	27.50%
1958	66 and 8 months	28.33%
1959	66 and 10 months	29.17%
1960 or later	67	30%

Early or late?

Should you begin receiving Social Security benefits early, or wait until full retirement age or even longer? If you absolutely need the money right away, your decision is clear-cut; otherwise, there's no "right" answer. But take time to make an informed, well-reasoned decision. Consider factors such as how much retirement income you'll need, your life expectancy, how your spouse or survivors might be affected, whether you plan to work after you start receiving benefits, and how your income taxes might be affected.

Millennials and Retirement Planning

A September 2015 study found that 60% of millennials think planning for retirement is harder than sticking with a diet and exercise plan. By contrast, 61% of baby boomers think dieting/exercising is harder, and 51% of Gen Xers think retirement planning is harder.

The Importance of Saving for Retirement at a Young Age

If you're an adult in your 20s, you are entering an exciting stage of life. Whether you've just graduated from college or are starting a new career, you will encounter many opportunities and challenges as you create a life of your own.

As busy as you are, it's no surprise that retirement may seem a long way off, especially if you're just entering the workforce. What you may not realize, however, is that there are four very important advantages to begin planning and saving for retirement now.

1. Money management skills

Now that you're out on your own, it's important to start taking responsibility for your finances little by little. Part of developing financial responsibility is learning to balance future monetary needs with present expenses. Sometimes that means saving for a short-term goal (for example, buying a new car) and a long-term goal (for example, retirement) at the same time.

Once you become used to balancing your priorities, it becomes easier to build a budget that takes into account both fixed and discretionary expenses. A budget can help you pursue your financial goals and develop strong money management skills. If you establish healthy money habits in your 20s and stick with these practices as you grow older, you'll have a major advantage as you edge closer to retirement.

2. Time on your side

When you're young, you have the benefit of time on your side when saving for long-term goals (like retirement). You likely have 40-plus years ahead of you in the workforce. With that much time, why not put your money to work using the power of compounding?

Here's a hypothetical example of how compounding works. Let's say that at age 25, you start putting \$300 each month into your employer's retirement savings plan, and your account earns an average of 8% annually. If you continued this practice for the next 40 years, you would have contributed \$144,000 to your account, accumulating just over \$1 million by the time you reached age 65. But if you waited 10 years until age 35 to start making contributions to your plan, you would have accumulated only \$440,000 by age 65.

Note: This hypothetical example of mathematical compounding is used for illustrative purposes only and does not represent any specific investment. Taxes and investment fees are not considered. Rates of return will vary over time, especially for long-term investments. Investments offering the potential for higher rates of return also involve a higher degree of risk. Actual results will vary.

3. Workplace retirement benefits

If your employer offers a workplace retirement plan such as a 401(k) or 403(b), you may find that contributing a percentage of your salary (up to annual contribution limits) will make saving for retirement easier on your budget. Contributions are typically made on a pre-tax basis, which means you can lower your taxable income while building retirement funds for the future. You aren't required to pay any taxes on the growth of your funds until you take withdrawals. Keep in mind that distributions from tax-deferred retirement plans are taxed as ordinary income and may be subject to a 10% federal income tax penalty if withdrawn before age 59½.

Depending on the type of plan, your employer may offer to match a percentage of your retirement plan contributions, up to specific limits, which can potentially result in greater compounded growth and a larger sum available to you in retirement.

If you don't have access to a workplace retirement savings plan, consider opening an IRA and contribute as much as allowable each year. An IRA may offer more investment options and certain tax advantages to you.

If you have both a workplace plan and an IRA, one strategy is to contribute sufficient funds to your workplace plan to take advantage of the full company match, and then invest additional funds in an IRA (up to annual contribution limits). Explore the options available to find out what works best for your financial situation.

4. Flexibility of youth

Although there's a good chance you have student loans, you probably have fewer financial responsibilities than someone who is older and/or married with children. This means you may have an easier time freeing up extra dollars to dedicate toward retirement. Get into the retirement saving habit now, so that when future financial obligations arise, you won't have to fit in saving for retirement too--you'll already be doing it.

How is GDP calculated in the U.S.?

GDP, or gross domestic product, is a measurement of the total value of all goods and services produced in the United States over a given

time period. It is used by economists, government officials, market forecasters and others to gauge the overall health of the U.S. economy.

Although there are several ways of calculating GDP, the *expenditures approach* is the most common. It focuses on final goods and services purchased by four groups: consumers, businesses, governments (federal, state, and local), and foreign users.

The calculation and a description of its components follow:

C+I+G+(X-M)

Consumption (C): Also known as personal consumption, this category measures how much all individual consumers spend in the U.S.

Investment (I): Not to be confused with investments in the stock and bond markets, this is the amount businesses spend on fixed assets (e.g., machines and equipment) and

inventories, as well as the amount spent on residential construction.

Government (G): This category tracks the amount the government spends on everything from bridges and highways to military equipment and office supplies. It does not include "transfer payments"--for example, Social Security and other benefit payments.

Exports (X): This is the value of goods and services produced in the U.S. and purchased in foreign countries.

Imports (M): This is the value of goods and services produced in foreign countries and purchased in the U.S.

Historically, the U.S. has run a "trade deficit," which means imports have outpaced exports.

Once the final GDP values are calculated, the percentage change is calculated from one time frame to the next, generally quarter to quarter or annually. Reported quarterly by the Bureau of Economic Analysis, these percentages can influence both investment markets and policy decisions.

What is the most important component of GDP in the United States?

We often hear in the media that consumer spending is crucial to the overall health of the U.S. economy, but exactly

how important is it? Representing approximately two-thirds of overall GDP, consumption--the almighty consumer--is the largest driver of economic growth in the United States. Of the nearly \$18 trillion in U.S. GDP (2015), American shoppers are responsible for a piece of the pie worth about \$12 trillion.

Consumption is tracked by the Bureau of Economic Analysis, and is reported as Personal Consumption Expenditures (PCE) in its monthly "Personal Income and Outlays" news release. Since the late 1960s, PCE as a percentage of overall GDP has crept up from a low of approximately 58% to nearly 70% today.

PCE is divided into goods and services. The services category typically represents the largest part of PCE, accounting for more than 65% over the past two years. Examples of services include health care, utilities, recreation, and financial services.

Goods are broken down further into durable and nondurable goods. Durable goods are those that have an average life of at least three years. Examples include cars, appliances and furniture. Nondurable goods are those with an average life span of less than three years and include such items as clothing, food, and gasoline.

Durable goods represent approximately 10% of total PCE, while nondurable goods make up about 20%.

So the next time you're out shopping, for anything from a bottle of ketchup to a new car, consider that you're doing your part to fuel our nation's growth.
